DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1, 3-9, 11, 13-21 and 23-27 are rejected under 35 U.S.C. 102(b) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Rehman (US Patent 6,177,498).

Rehman teach a solvent system has been found which aids in start-up, drop ejection, decap and high frequency firing above 10 kHz for inks that comprise latex polymers. Two solvents 3-hexyne-2,5-diol and 1,2-octanediol in combination improve printability in latex polymer-containing ink jet ink which comprise one or more pigments and a vehicle comprising at least one organic, water-soluble solvent and water (abstract). The reference further teaches black inks comprising a pigment and a vehicle, wherein the about 5 to 50 percent by weight of a water-soluble organic solvent,

Application/Control Number: 10/791,007

Art Unit: 1755

about 0.05 to 10 percent by weight of a pigment, about 0.005 to 50 percent of durable latex polymer and water, in addition to the ester or diol/triol additive (col. 3 lines 26-37). The reference also teaches that the colorant may be self-dispersing pigment. The organic groups attached to the colorant that make the pigment self-dispersing include sulfonic acid, phosphonic acid, carboxylic acid, ammonium, quaternary ammonium or phosphonium group (col. 3 lines 39-56). The method for modifying pigments to be self-dispersing is treatment of a carbon black pigment with aryl diazonium salts comprising at least one acidic functional group, wherein the aryl diazonium salts include 4-aminobenzoic acid (col. 3 lines 63+). The vehicle of the ink composition comprises one or more co-solvents and water. The reference teaches that the preferred solvents include 1,5-pentanediol, 1,3,5-(2-methyl)-pentanetriol, and 3-methoxy-3-methylbutanol (col. 5 line 60-col. 6 line 21). When the reference has a firing frequency of 15 to 25 kHz the reference appears to the claimed invention.

And in the alternative when the firing frequency is just outside of the claimed range a prima facie case of obviousness exists where the claimed ranges and prior art ranges do not overlap but are close enough that one skill in the art would have expected them to have the same properties *Titanium Metals Corp of America v. Banner*, 778 F.2d 775, 227 USPQ 773.

Claims 2, 12, and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Rehman (US Patent 6,177,498) as applied to claims 1, 3-9, 11, 13-21, and 23-27 above, and further in view of Belmont (US Patent 5,571,311).

Rehman is described above, but fails to teach the pigment particle size.

Application/Control Number: 10/791,007

Art Unit: 1755

Belmont teaches an aqueous ink jet ink composition comprising a carbon black product that is being treated with diazonium salts (abstract and col. 4 lines 36+). The reference further teaches in the examples particles sizes that overlap Applicant's claimed range, so not to clog the printhead nozzle (col. 2 lines 23-37).

Therefore it would have been obvious to one of ordinary skill in the art to use the carbon black particle size as taught by Belmont in the ink composition of Rehman so that the carbon black particle do not clog the print nozzles.

Conclusion

The remaining references listed on forms 892 and 1449 have been reviewed by the Examiner and are considered to be cumulative to or less material than the prior art references relied upon in the above rejections.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Veronica F. Faison whose telephone number is 571-272-1366. The examiner can normally be reached on Monday-Thursday and alternate Fridays 8 am to 5 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mark Bell can be reached on 571-272-1362. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
